Why add Lipoprotein(a) to your Coronary Risk Assessment?
Since approximately 50% of people who have heart attacks have normal cholesterol levels, doctors are starting to look at other factors that may contribute to heart disease.

Lp(a), along with other cardiac risk markers, such as Cholesterol, HDL, LDL, Triglycerides, Apo A1, and Apo B, should be tested to screen patients for coronary artery disease and cerebral vascular disease. Lp(a) should be tested on patients who have a strong family history of premature coronary artery disease or when the doctor suspects a familial hypercholesterolemia. Lp(a) should be ordered on patients who have had a stroke or heart attack, but their lipid profile is normal or only mildly elevated.

Related Testing:
Lipid Panel: Cholesterol, Triglycerides, HDL Apolipoprotein A1, Apolipoprotein B, LDL-C

Reimbursement:
CPT Code: 83695

For Use On:
ACE Alera® Clinical Chemistry System
ACE® Clinical Chemistry System
